Developer Onboarding Guide

Day 1: receive your laptop, set up two-factor authentication and request access to the repositories and the staging environment. Day 2: clone the monorepo, run the setup script and start the backend and the frontend locally.

Backend: Python 3.11 with FastAPI and a MySQL database. Frontend: React with Vite. Run the test suites before every pull request.

First week

Pair with a buddy on a starter ticket, attend the architecture walkthrough and read the API security guidelines and the git workflow. By Friday you should have your first pull request merged.
